

## Additional information

Kiwi-eye system is based on an artificial intelligence algorithm that is able to recognize people in a video stream. It is important to underline the fact that the system is only able to detect a person if a human being would be able to do so: people hidden from view are not detected, as well as people who are almost completely hidden; but a partially occluded person is detected (just as a human being would be able to do).

N.B. Kiwitron systems are man-machine detection systems, to be considered as vehicle assistance systems and not as safety systems.
